

BREEDING OBJECTIVES

The Farrer breeding program is centered on a sound combination of genetic principles and practical experience with the aim of breeding modern, profit-making sires for commercial lamb production.

Our breeding objective is to select and breed for:

- Easy lambing (Low birth weights)
- Growth Rate
- Moderate Leanness
- Muscling (high Eye Muscle Depth)
- Worm resistance (low WEC)
- Carcase Qualities (LMY, IMF, SHEARF5)
- Fertility
- Structural soundness (Rams are independently assessed since 2009)
- Lack of Pigmentation

Farrer uses the LEQ index to help in selecting ewes that are retained in the stud and those rams used as backup rams and offered for sale.

All breeding females have been genomics DNA tested for LMY, IMF & SF5 since 2016
